KEY seed plate ·design drawing, full size

A steel plate that stores a twelve-word seed without words: twelve rows of eleven punch positions, grouped 2 | 5 | 4 like the dice, and a box of four digits at the end of each row.

Drawn for **3 mm number stamps**, which is an assumption. Punch cells are 6 mm, digit cells 5 × 6 mm. Dimensions in millimetres. Row 1 is filled in as an example (1091). Print at 100% and check the top edge measures 120 mm.

Made in advance (etched or engraved)

- The grid, the group frames and the number box.
- A dashed ring in each cell, as the target for the punch.
- One die face above each column, showing that die's dot count: 1–2, 1–5, 1–4.
- Row numbers 1 to 12.
- The legend: **BIP39 ·0000 = abandon ·● = 1**.
- The cut corner, top right, so the plate cannot be read upside down or back to front.

Made by hand in the ceremony

- **Dots:** one centre-punch mark for each die showing dots. Blank cells stay untouched.
- **Digits:** four number stamps per row, 48 strikes in all.
- **Row 12:** the first seven dots come from the dice; the four shaded cells come from LOCK.

Why both dots and digits

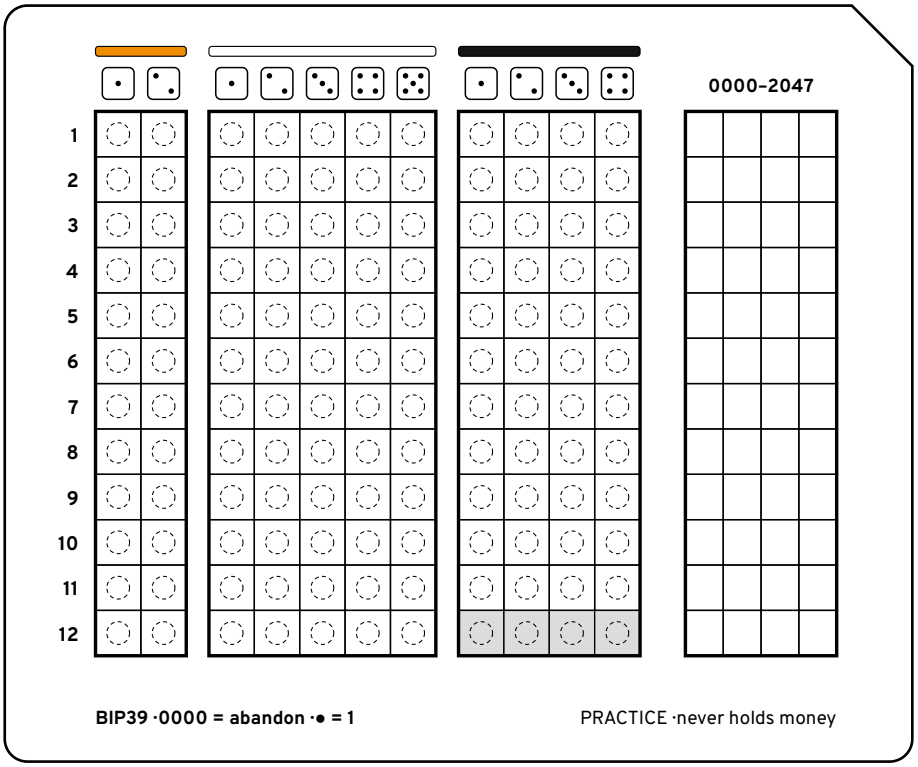

Each row is recorded twice. A wrong dot, a wrong digit, or a dot added later makes the row and its number disagree.

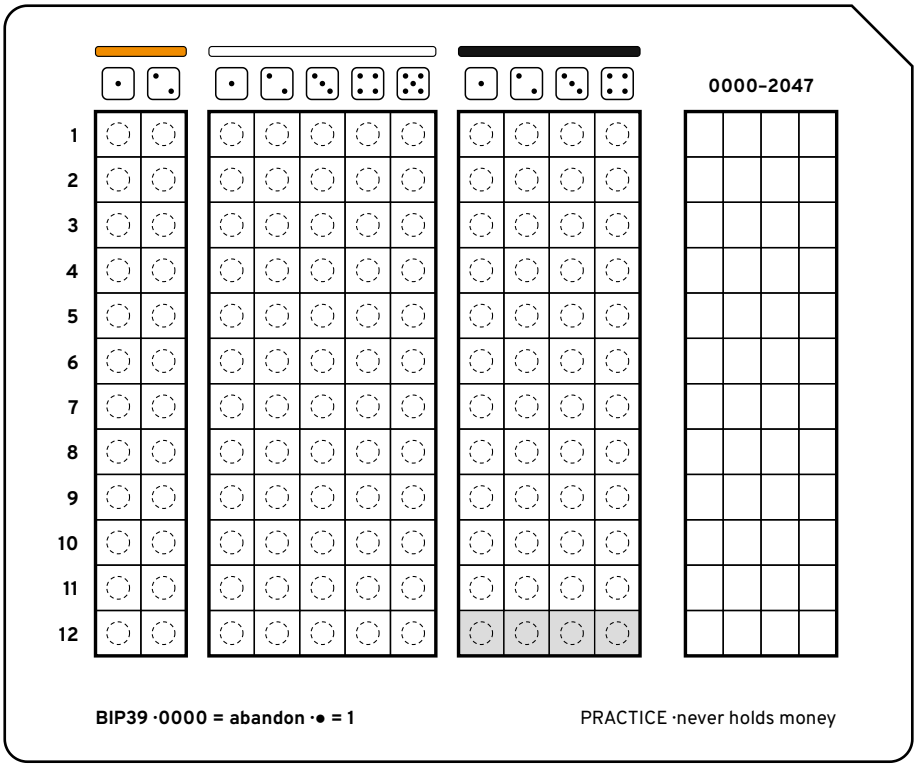

Still to decide

- Steel grade and thickness, and how the grid is put on (laser etch, acid etch, engraving).
- Fixing or sealing: no holes are drawn. Add them once the case or seal is chosen.
- Whether the legend's one English word stays, or is replaced by a symbol for "standard list".
- Where the xpub and the key's fingerprint go: the back of this plate, or a separate one.

KEY paper plates ·for the dry run, full size

Cut out and mark with a pen: a filled dot for each die showing dots, and four digits in the box. The coloured bars match the dice and are on the paper version only.

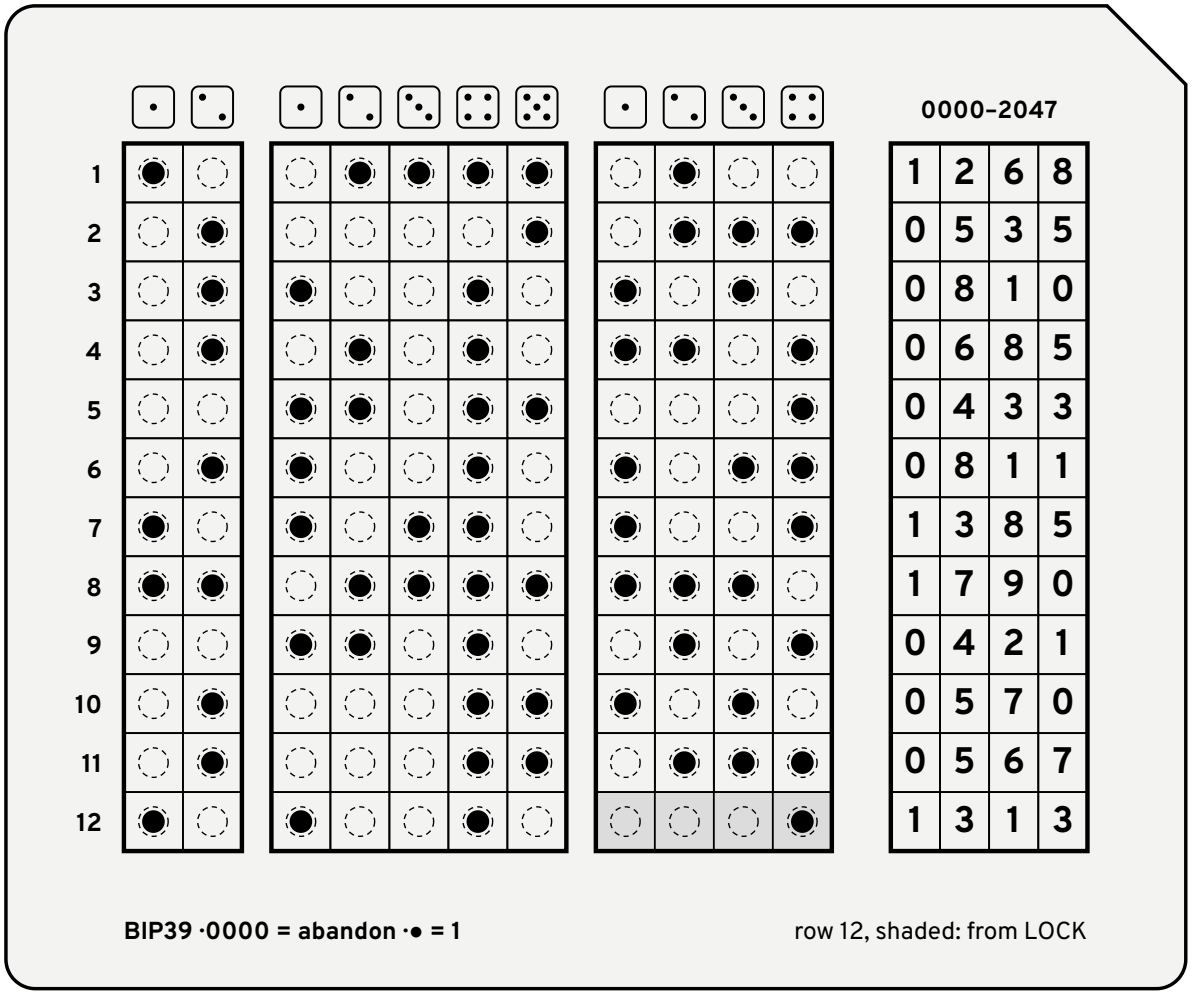

Two plates, so the run can be done twice or by two people. Destroy both when the dry run is finished.

KEY seed plate ·worked example

A published test key, cut onto the plate: what a finished plate looks like, and something to practise reading. It is a test pattern: never send money to it.

Read it back

Take any row. The first two cells give the sheet (A to D), the next five the row, the last four the column. The number printed there on the number sheets must equal the four digits in the box.

Row 12: the first seven cells came from the dice, the four shaded cells from LOCK.

Prove it

Look up the twelve numbers on the word sheets and restore the words in a wallet. Its master fingerprint must be **a07d432c**.

The twelve rows

Row	Number	Word
1	**1268**	ozone
2	**0535**	drill
3	**0810**	grab
4	**0685**	fiber
5	**0433**	curtain
6	**0811**	grace
7	**1385**	pudding
8	**1790**	thank
9	**0421**	cruise
10	**0570**	elder
11	**0567**	eight
12	**1313**	picnic

The xpub grid's worked example uses a different published test key (*abandon* eleven times, then *about*), because that is the one LOCK's first-run guide checks.
