KEY run sheet ·flow B: SeedSigner check

A second, independent check of the practice key from flow A. The SeedSigner shares no code with LOCK or its stand-in. It loads the key from the seed plate's twelve numbers, with no words typed, and must arrive at the same address as the lock plate. Allow about 15 minutes.

Practice only. Do this after flow A, Part F, and before anything is destroyed. The key must never hold money.

From flow A

- The finished paper seed plate
- The finished paper lock plate, with the address written out

New for flow B

- A SeedSigner, with its microSD card and a power supply
- A computer or tablet to show `key-seedqr.html`. It needs no network
- The phone, as a QR reader
- Word sheets A to D, for the optional Part 4

SeedSigner settings. The steps below assume factory settings. If a screen named here does not appear, that choice has been switched off in **Settings**, and the SeedSigner skips it. No passphrase is used.

Before you start, test the route with the worked example. Open `key-seedqr.html`, press **Worked example**, and scan the code with the SeedSigner (**Scan** on its home screen). It must show fingerprint **a07d432c**, and its first receiving address must be the one on the lock plate example. Then choose **Discard seed**.

Part 1 ·Draw the SeedQR

- ☐ **1** **Open** `key-seedqr.html` on the computer or tablet and press **Clear**.
- ☐ **2** **Type** the twelve numbers from the seed plate, top to bottom.
- ☐ **3** **Check.** Checker compares the dots on the screen with the dots on the seed plate, row by row.
- ☐ **4** **Read the message.** The page must say "All twelve rows fit" and show a code. If it says row 12 does not fit, stop: the plate and the screen disagree.

Part 2 ·Load the key

- ☐ **5** **Power on** the SeedSigner. On its home screen choose **Scan**.
- ☐ **6** **Scan** the code on the screen. Hold the camera steady, a hand's width away.
- ☐ **7** **Accept the key.** The SeedSigner shows **Finalize Seed** and an eight-character fingerprint. Press **Done**.
- ☐ **8** **If it refuses.** If the SeedSigner shows **Invalid Mnemonic!** instead, the check has failed: see the table on page 2.

Part 3 ·Find the address

- [ ] **9** **Choose Address explorer**, then **Native Segwit**, then **Receive addresses**.
- [ ] **10** **Select the first address** in the list, numbered 0. The SeedSigner shows it as a code.
- [ ] **11** **Scan** the SeedSigner's screen with the phone and read the text.
- [ ] **12** **Check 1.** The text must equal the address written from the lock plate, character for character. Tick the result table.

This is the whole point of flow B: two machines that share no code, given the same twelve numbers, must name the same address.

Part 4 ·The words (optional: checks the word sheets)

- [ ] **13** **Go back** to the seed's menu and choose **Backup seed**, then **View seed words**. Accept the warning.
- [ ] **14** **Check 2.** For each of the twelve rows, find the plate's number on the word sheets. The word printed there must be the word the SeedSigner shows at that position. Tick the result table.

Part 5 ·Clear up

- [ ] **15** **SeedSigner:** go back to the seed's menu and choose **Discard seed**. Then power off and unplug it.
- [ ] **16** **Computer or tablet:** press **Clear** and close the page.
- [ ] **17** **Return** to flow A, Part G, to destroy the plates and any slip.

Result

Check	Match	No match
1 ·Address: SeedSigner against the lock plate	☐	☐
2 ·Words: SeedSigner against the word sheets (optional)	☐	☐

If a check fails

What you see	Where to look first
The page says row 12 does not fit	A number typed wrongly, or the plate's row 12 does not match rows 1 to 11. Compare the screen's dots with the plate.
Invalid Mnemonic!	The SeedSigner and the page disagree about row 12. This should not happen: note the twelve numbers of this practice key before destroying it.
Check 1 fails	First compare the numbers typed here with the numbers given to the stand-in in flow A. If they are the same, look for a copying slip on the lock plate: an odd row, or a number that does not match its dots. If the plate matches the stand-in's screen, the stand-in and the SeedSigner disagree, which is a fault in LOCK's reference program.
Check 2 fails	A printing or lookup error in the word sheets.
