KEY run sheet ·flow B: SeedSigner check

A second, independent check of the practice key from flow A. The SeedSigner shares no code with LOCK or its stand-in. It loads the key from the plate's twelve numbers, with no words typed, and must arrive at the same fingerprint and public key as the hand-drawn xpub grid. Allow about 20 minutes.

Practice only. Do this after flow A, Part F, and before anything is destroyed. The key must never hold money.

From flow A

- The finished paper seed plate
- The finished xpub grid, with the fingerprint written in its box
- The text the phone read from the grid, still on the phone

New for flow B

- A SeedSigner, with its microSD card and a power supply
- A computer or tablet to show `key-seedqr.html`. It needs no network
- The phone, as a QR reader
- Word sheets A to D, for the optional Part 4

SeedSigner settings. The steps below assume factory settings. If a screen named here does not appear, that choice has been switched off in **Settings**, and the SeedSigner skips it. No passphrase is used.

Before you start, test the route with the worked example. Open `key-seedqr.html`, press **Worked example**, and scan the code with the SeedSigner (**Scan** on its home screen). It must show fingerprint **a07d432c**. Then choose **Discard seed**.

Part 1 ·Draw the SeedQR

- [ ] **1** **Open** `key-seedqr.html` on the computer or tablet and press **Clear**.
- [ ] **2** **Type** the twelve numbers from the plate, top to bottom.
- [ ] **3** **Check.** Checker compares the dots on the screen with the dots on the plate, row by row.
- [ ] **4** **Read the message.** The page must say "All twelve rows fit" and show a code. If it says row 12 does not fit, stop: the plate and the screen disagree.

Part 2 ·Load the key

- [ ] **5** **Power on** the SeedSigner. On its home screen choose **Scan**.
- [ ] **6** **Scan** the code on the screen. Hold the camera steady, a hand's width away.
- [ ] **7** **Read the fingerprint.** The SeedSigner shows **Finalize Seed** and eight characters. **Check 1:** they must equal the fingerprint written on the xpub grid. Tick the result table.
- [ ] **8** **Press Done**. If the SeedSigner shows **Invalid Mnemonic!** instead, the check has failed: see the table on page 2.

Part 3 ·Export the public key

☐ **9** **Choose Export xpub**, then **Single Sig**, then **Native Segwit**, then **Static**.

☐ **10** **Accept** the privacy warning. The next screen lists the fingerprint, the path **m/84'/0'/0'** and the start of the key. Choose **Export xpub**.

☐ **11** **Scan** the SeedSigner's screen with the phone and read the text.

☐ **12** **Check 2.** Compare it with the text the phone read from the xpub grid. The fingerprint and the long key starting **zpub** must be the same: compare the first ten and the last six characters of the key. Tick the result table.

The two texts differ in one harmless way. The SeedSigner writes the path as **84'/0'/0'** and LOCK writes it as **84h/0h/0h**. They mean the same thing. The pictures will also differ, because the two machines draw the code in different patterns. Only the text is compared.

Part 4 ·The words (optional: checks the word sheets)

☐ **13** **Go back** to the seed's menu and choose **Backup seed**, then **View seed words**. Accept the warning.

☐ **14** **Check 3.** For each of the twelve rows, find the plate's number on the word sheets. The word printed there must be the word the SeedSigner shows at that position. Tick the result table.

Part 5 ·Clear up

☐ **15** **SeedSigner:** go back to the seed's menu and choose **Discard seed**. Then power off and unplug it.

☐ **16** **Computer or tablet:** press **Clear** and close the page.

☐ **17** **Return** to flow A, Part G, to destroy the plate, the grid and any slip.

Result

Check	Match	No match
1 ·Fingerprint: SeedSigner against the xpub grid	☐	☐
2 ·Public key (zpub): SeedSigner against the xpub grid	☐	☐
3 ·Words: SeedSigner against the word sheets (optional)	☐	☐

If a check fails

What you see	Where to look first
The page says row 12 does not fit	A number typed wrongly, or the plate's row 12 does not match rows 1 to 11. Compare the screen's dots with the plate.
Invalid Mnemonic!	The SeedSigner and the page disagree about row 12. This should not happen: note the twelve numbers of this practice key before destroying it.
Check 1 fails	The numbers typed are not the numbers the stand-in was given in flow A. If they are the same, the stand-in and the SeedSigner disagree, which is a fault in LOCK's reference program.
Check 1 passes, check 2 fails	A copying slip in the xpub grid that still scanned, or the wrong choice at **Native Segwit**.
Check 3 fails	A printing or lookup error in the word sheets.
